

The repeated minimum already exists in the deposited measurement file

One 2019-12-19 CAV1-labelled acquisition: all 1,286 TSV rows align with the RTDC member.

20 same-named scalar columns match export precision; deformation is recomputed from stored circularity.

528 events have stored FL2 maximum 0.10000000149 a.u.; TSV export did not create this minimum.

Flooring each full median-trace maximum fails for 272 events. Peak extraction, detector limits and censoring remain unresolved.

Shared 0–255 image scale and full shared trace range. Pixels/traces unchanged; two explicitly selected events are illustrative only.
